

Churn Model For Pilot Program

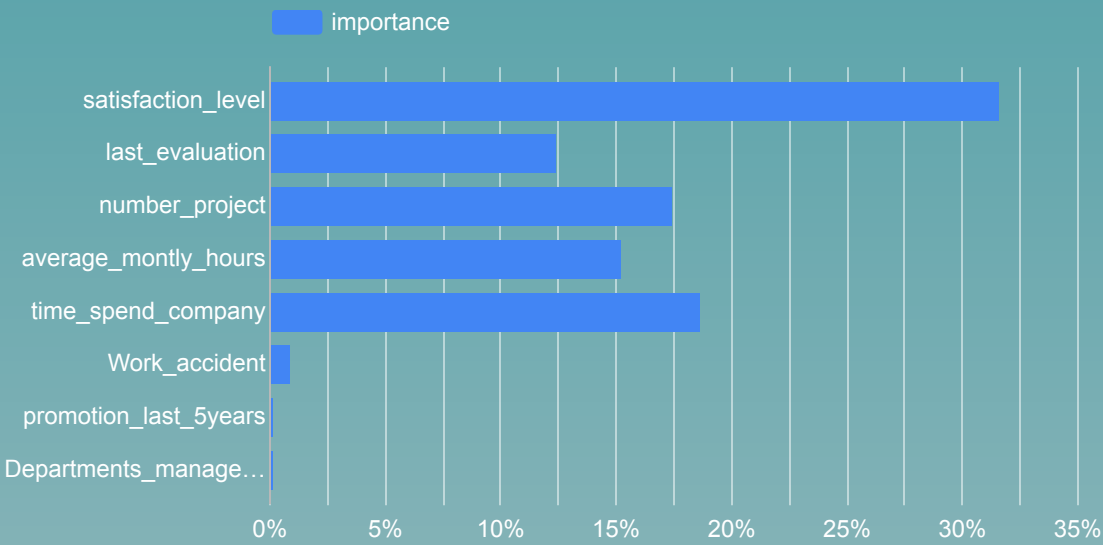

Our Employee At Risk Pilot Program

Identifying at risk employees: Churn models can highlight employees who may be considering leaving the company, allowing HR to take protective measures to address their concerns, understanding turnover causes: by analyzing factors that contribute to churn, HR can identify and address systemic issues in the organization, such as management practices, workload, or lack of career development opportunities. Enhancing employee retention strategies: insights from these models can guide the development of targeted retention programs and policies.

Supporting Metrics

What is Driving Churn

What Our Algorithm Found

The Random Forest model identified employee satisfaction as the most important factor in predicting whether employees are likely to stay with the company or leave. Employees who have been with the company longer tend to manage more projects. In addition, employees who work a moderate number of hours and receive higher performance evaluations are more likely to stay. Interestingly, whether an employee has experienced a workplace accident does not appear to have a significant impact on their decision to leave. These insights can help the company take targeted steps to improve employee satisfaction and retain valuable talent.

Where Are People Leaving
